

## Pottstown - Controls

Pottstown, PA, United States  
Dimonoff

---

Located along the Schuylkill River, Pottstown continues to invest in modern infrastructure to improve safety, efficiency, and sustainability throughout the borough. As part of this initiative, the city upgraded its lighting system with advanced wireless controls from DimOnOff to support smart city capabilities. The RTM internal unit, a discreet control system designed to fit directly inside the lighting fixture, allows for seamless integration without altering the appearance of existing luminaires.

Independence Lighting played a key role in the project by developing a mounting approach for the RTM units and supporting their integration into the existing fixtures. Today, more than 1,900 wireless control units are installed throughout the borough, including several RME devices installed on cobrahead fixtures. Independence Lighting also commissioned and programmed the devices, ensuring the system operates efficiently and as intended.

Through the implementation of this technology, Pottstown continues to take a significant step toward a more connected and energy-efficient lighting network, helping create a smarter and more responsive community.
