

New Jersey State Capital

Trenton, NJ, United States
Spring City Electrical

Dating back to 1792, the New Jersey State Capital stands as the third oldest continuously operational statehouse in the United States. A recent major restoration project carefully preserved the building’s historic character while enhancing its visual presence for future generations.

Custom-designed poles and luminaires by Spring City Electrical played a key role in complementing the State House’s architectural heritage. Whether developing historically accurate reproductions or creating bespoke designs, Spring City Electrical’s engineering team supported the project from concept through execution.

From a simple sketch, reference image, or sample, Spring City Electrical continues to transform ideas into beautifully crafted, site-sensitive lighting solutions. The result: A revitalized landmark where history, craftsmanship, and modern performance come together.
