

Penn Street Bridge Relighting

Reading, PA, United States
Spring City Electrical / Dimonoff

As part of a PennDOT-led infrastructure improvement initiative, the Penn Street Bridge relighting project enhanced nighttime visibility while reinforcing the bridge's visual identity. Decorative luminaires and poles from Spring City Electrical were supplied to complement the structure's historic character and deliver consistent, high-quality illumination.

Dimonoff wireless street lighting controls were integrated to manage the decorative light standards along the corridor. Independence Lighting was responsible for commissioning and programming the wireless controls system, ensuring reliable operation, scheduling flexibility, and improved energy performance.

Together, the lighting, poles, and controls create a cohesive, efficient, and modernized nighttime environment.
